Looking Glass

A Looking Glass is a web front end giving limited access to a router or route-collector/server for:

- Viewing the BGP table
- Allowing IXP members to verify their outbound BGP policies
- Viewing individual paths
- Checking traceroute and ping to destinations
- Checking RPKI status

Implementations

There are several Looking Glass implementations:

- Birdspy (only for bird)
- G Mazoyer’s Looking Glass
- John Frazier's original
- John Heasley’s built in to RANCID

Some operators (network and IXP) write their own implementations to match their particular requirements.

Public Looking Glasses

PeeringDB entries for every AS holder will normally (and are encouraged to) document how to access the operator or IXP's Looking Glass. A common entry point in the past was www.traceroute.org but that does not seem to have been updated recently.

One of the most popular looking glasses globally is RouteViews operated by the RouteViews team at the University of Oregon. This has 36 locations around the globe and a large number of BGP feeds terminating at the various collectors globally.

The other commonly used Looking Glass is bgp.he.net which gives Hurricane Electric's perspective of the global internet as seen from all their points of presence around the world.

Using Looking Glasses

The use of Looking Glasses to ascertain routing information and help with troubleshooting is covered elsewhere in the Toolbox.
